Project Title:

Integrated Digital Healthcare and Online Pharmacy Management System

PROJECT DESCRIPTION

Integrated Digital Healthcare and Online Pharmacy Management System is a fully online platform designed to provide end-to-end digital healthcare services and medicine delivery through a single application. The system enables patients to consult doctors remotely, receive electronic prescriptions, and purchase prescribed medicines from registered online pharmacies without the need for physical hospital visits.

The platform connects three primary stakeholders—Patients, Doctors, and Pharmacists—with secure role-based access. Patients can register, book online appointments, attend e-consultations, view digital prescriptions, and order medicines with home delivery. Doctors can manage virtual appointments, maintain patient records, and generate e-prescriptions. Pharmacists can verify prescriptions, manage orders, and handle dispatch of medicines. An integrated payment gateway ensures secure online transactions.

The system eliminates paperwork, reduces waiting time, prevents prescription misuse, and maintains centralized electronic health records. It provides a convenient, scalable, and secure solution for modern tele-healthcare and online pharmacy management.
